## Safety precautions

Always read this section before starting use.

Refer to Intro 71 for general precautions of the cylinder, and to Intro 78 for general precautions of the cylinder switch.

Free locking positioning medium bore size cylinder USC Series

### Design & Selection

#### ⚠ WARNING

- This cylinder has position locking (holding of cylinder static state) mechanism. Life drops markedly if used for emergency stops (stopping while the cylinder is moving).
- If back pressure is applied to the locking mechanism, the lock may be released. Use a discrete valve, or use an individual exhaust type manifold.
- Do not apply torque to the rod in locked state because holding force drops and create a hazard. Use a mechanism that does not rotate the rod.
- To release the lock, when using forward locking, supply pressure to port B, and when using backward locking, supply pressure to port A. Check that load is not applied to the locking mechanism. When both ports A and B are exhausted and the piston is locked, if pressure is supplied to port A for forward locking or to port B for backward locking, the lock may not be released or, even if released, the piston rod may pop out, creating a hazard.

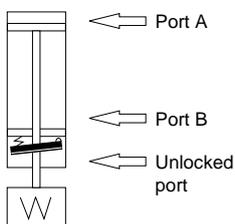

#### ⚠ CAUTION

##### ■ Basic circuit diagram

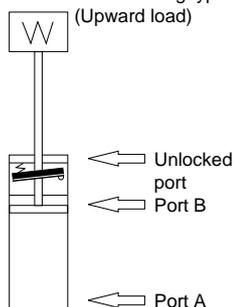

Pipe air piping for this cylinder as shown below. Faults such as a delayed response may result if piping other than that below is used, such as independent piping to the position locking mechanism.

1. As shown below, branch the piping to this cylinder at a position behind the valve, and pipe to the position locking section (connect main pipe to lock release port) and to the cylinder section (connect branched pipe to cylinder port).
2. If cylinder operation is faster than lock release, the lock may not be released or, even if released, the piston rod may pop out. This is hazardous, so design piping so that lock release is faster than cylinder operation.

Free locking positioning medium bore size cylinder  
With brake

## Installation & Adjustment

### ⚠ WARNING

- Do not apply torque to the rod in locked state because holding force drops and create a hazard. Use a mechanism that does not rotate the rod.
- Do not apply torque to the rod in locked state because holding force drops and create a hazard.

### ⚠ CAUTION

- When using several cylinders synchronized, install a separate guide.  
If only cylinders are used, synchronization is not possible, the rod twists, and operation becomes faulty.

## During Use & Maintenance

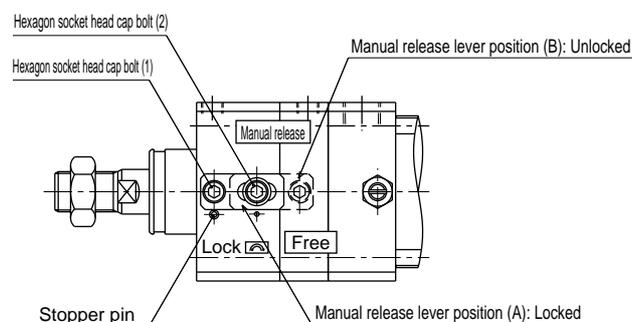

### ⚠ WARNING

- Do not disassemble the lock unit, since this may cause a hazardous situation.
- To prevent faults, use a dust cover during operation except when manually releasing brakes.
- For safety purposes, prevent the load from dropping under its own weight during maintenance.

### ⚠ CAUTION

- When locking the first time after leaving the lock released for a long time, a delayed response may occur in the lock. Do not leave the lock pressurized, and operate the lock at each cylinder operation.  
(Use the basic circuit diagram shown on page 1402)
- If the cylinder is held while pressure is applied on the locking mechanism, the lock could be released. Thus, do not use the 3-position closed center or 3-position P/A/B solenoid valve.
- Due to the structure, the piston rod drops by about 1 mm when the lock is applied.
- If no air pressure is supplied in vertical mounting, etc., holding force may not be sufficient when the lock is manually released. This may cause the rod to move (drop) with the load's weight.  
For safety, take the following measures before manually releasing the lock:
  - Move the load to the lowest end.
  - Provide a stopper on the load.
  - Supply air pressure to the cylinder and balance the load.
- Set the manual release lever to the lock position during normal use.

### ■ How to unlock manually

#### ● Unlocked

- 1) Loosen the hexagon socket head cap screw (1) 3 or 4 turns.
- 2) Loosen the hexagon socket head cap screw (2) 1 or 2 turns.
- 3) Turn the manual release lever from the manual release lever position (A) to (B) 180° in the direction of the arrow.
- 4) The piston lock is freed.

#### ● Lock operation

- 1) Turn the manual release lever from the manual release lever position (B) to (A) 180° in the direction of the arrow.
- 2) Tighten the hexagon socket head cap screw (1) at the position where the release lever contacts the stopper pin.
- 3) Tighten the hexagon socket head cap screw (2).
- 4) Lock the piston rod.

Note: Turn the release lever in the direction of the arrow when manually releasing the lock.

The release lever must not be removed.

The release lever can be turned by loosening the hexagon socket head cap screw (2) by 1 or 2 turns. Tighten the hexagon socket head cap screw with a torque of 8 to 11 N·m.

- The cylinder may be damaged or may malfunction if a unit with excessive inertia, etc., is moved. Use within the allowable energy absorption range.

Holding force N		1005	1570	2493	4021	6283
Working piston speed mm/s		50 to 1000 (Use within the absorbed energy.)				
Cushion		The type with cushion or without cushion can be selected.				
Effective cushion length mm		14.6	16.6	16.6	20.6	23.6
Lubrication		Not required (when lubricating, use turbine oil Class 1 ISO VG32)				
Allowable energy absorption J	Cushioned	4.29	8.37	15.8	27.9	49.8
	No cushion	A large energy generated by an external load can not be absorbed, so an external shock absorber should be used.				

Note 1: When kinetic energy is large, such as large load and fast piston speed, etc., install an external shock absorber, and use this within the range of allowable kinetic energy.

## Stroke length

Bore size (mm)	Standard stroke length (mm)	Max. stroke length (mm)	Available stroke length (mm)	Min. stroke length (mm)
$\phi 40$	25, 50, 75, 100, 150, 200,	600	1600	1
$\phi 50$			2000	
$\phi 63$	250, 300, 350, 400, 450,	700	2500	
$\phi 80$	500			
$\phi 100$		800		

Note 1: Custom stroke length is available per 1mm increment.

Note 2: For the types with switch, min. stroke length varies depending on installation method. Refer to the table below.

When stroke length is shorter than 15 mm, two switches could turn ON at the same time. In this case, adjust the distance between switches as far as possible.

Note 3: Min. stroke length is available from 1mm, however the stroke tolerance should be considered.

Note 4: If the maximum stroke is exceeded, product specifications may not be met, depending on operating conditions. Refer to Ending 70.

## How to order

### ⚠ Note on model no. selection

- Note 1: Refer to page 1404 for min. stroke length with switch.
- Note 2: When selecting TA or TB for mounting, the number of switches is limited to "H" (one on head end) for TA, and "R" (one on rod end) for TB.
- Note 3: The instantaneous maximum temperature is that at which sparks, swarf, etc., temporarily contact bellows.
- Note 4: "I" and "Y" can not be selected at the same time.
